Flowcharting - Sequential and Decision Control Structure

1. Create a flowchart that would input five values of numbers and compute for the average. If the average is below 75, the remarks is “failed”, if not remark is “passed”. Print the average and remarks.

Flowcharting - Sequential and Decision Control Structure

2. Draw a flowchart that would get the name of an item(NI), quantity purchased (QP), and unit cost (UC). If the total cost(TC) is more than 5000. The net cost (NC) is computed as the difference in the total cost and ten percent discount(D) of the total cost(TC), otherwise the Net Cost = Total Cost

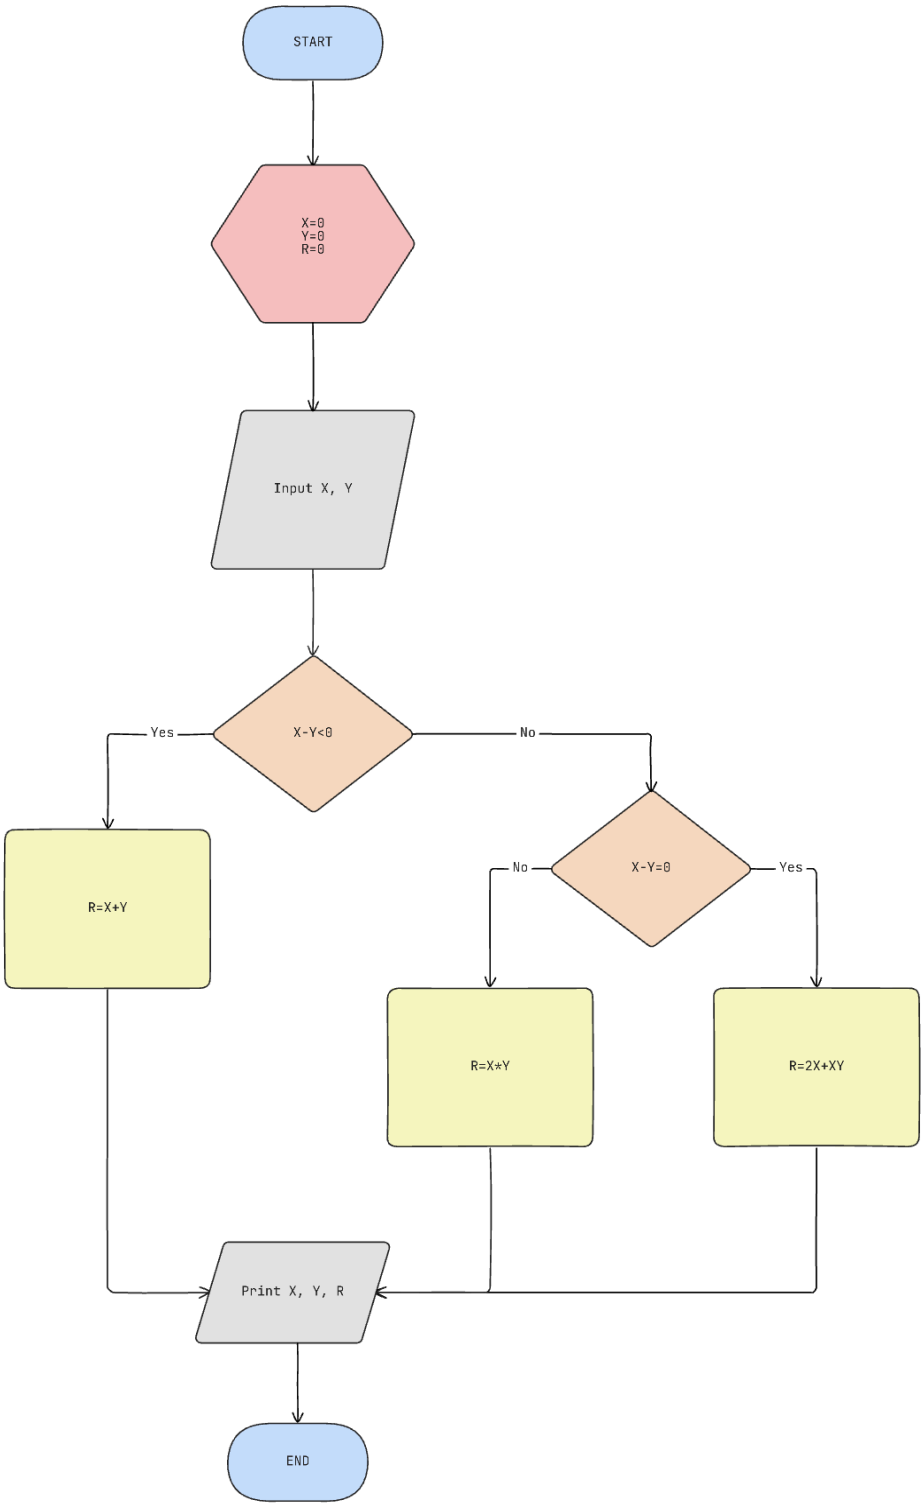

The Formula to compute:
Total Cost = Quantity Purchased * Unit Cost
Net Cost = Total Cost-Discount
Print the name of an item (NI), and net cost (NC).

3. Given two numbers X and Y. Draw a flowchart to determine the difference between X and Y. If X-Y is negative, compute R=X+Y, if X-Y is zero, compute R=2X+XY; and if X-Y is positive, compute R=X*Y. Print out the values of X, Y, and R.

4. The ABC Manufacturing Company plans to give a year-end bonus to each of its employees. Make a flowchart that will input the name and the salary then compute the bonus of an employee. Consider the following criteria: If the employee's monthly salary is less than 1,000.00 pesos, the bonus is 50% of the salary; for the employees with salaries greater than 1,000.00 pesos, the bonus is 1,000.00. Print out the name and corresponding bonus of the employee.
