1. Given the three numbers A, B, C. Write an algorithm to compute and print out the sum, the average, and the product of these values.

START
Let A = 0, B = 0, C = 0, Sum = 0, Ave = 0, Product = 0
Read/input A, B, and C
Compute Sum = A + B + C
Compute Ave = (A + B + C) / 3
Compute Product = A x B x C
Print Sum, Ave, and Product
END

2. Write an algorithm that will ask the user to get final grades. Evaluate the final grade, if the final grade is greater than75, indicate the remarks are “Passed”, if not the remarks are “Failed”. (Please refer to the slides for samples of conditions.)

START
Let FinalGrade = 0
Let Remarks = " "
Input FinalGrade
If FinalGrade > 75 then Remarks = “passed”
ELSE Remarks = “failed”
Display Remarks (“passed” or “failed”)
END

3. Given the value of the password is “JRU”, write an algorithm that if the user input the correct password, it will display “Password is Accepted” if not “Password is Incorrect”. (Please refer to the slides for samples of conditions.)

START
Let password= “JRU” user = "
Input user
If user = password then display "Password is Accepted"
ELSE display "Password is Incorrect"
END

4. Write an algorithm that would display numbers from 1-5. (Please refer to the slides for samples of conditions.)

START
 i = 1

Display i
 i = i + 1

If (i <= 5) then go to line 3
 END
